

ABSTRACT

An easy-to-use, intuitive previewing technique for enabling users to refresh their memories about the content of Web pages and/or files and other documents by previewing that content. The disclosed techniques enable previewing content without actually navigating to the Web page or without actually opening the file or document. A “previewer” graphic image may be dragged over a hyperlink or file name (or file icon) to signal that a preview of the associated Web page or file should be rendered.
